Eco-systems of agricultural landscapes and sustainable land use: Livestock systems

03 - Livestock Ecology - 2 Biotic environmental factors

M.Sc. Integrated Natural Resource Management Ecology and Sustainable Livestock Systems 03 – Livestock Ecology – 2 Winter Semester 2016/17

Life forms of animals

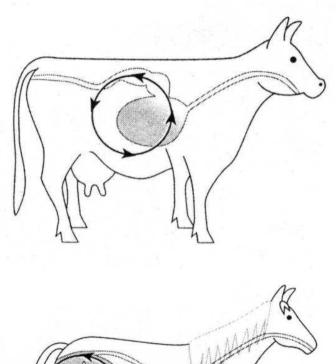

M.Sc. Integrated Natural Resource Management Ecology and Sustainable Livestock Systems 03 – Livestock Ecology – 2 Winter Semester 2016/17

Allocation of domestic livestock species to different feeding types

Herbivores (35)*	Bovidae	Cattle, Gayal (Mithan), Yak, Water Buffalo, She Bali Cattle, Wisent, Musk Ox, Eland, Oryx, Impa	
	Tylopodae Dromedary, Bactrian Camel, Llama, Alpaca		, Alpaca
	Cervidae	Reindeer, Red Deer, Fallow Deer, M	loose
	Equidae	Horse, Donkey	
	Proboscidae	Elephant	
Lagomorpha Rabbit Rodentia Guinea Pig, G		Rabbit	
		Guinea Pig, Great Cane Rat, Capybara	
	Insecta	Honey Bee, Silkworm	
	Mollusca	Escargot Snail, Giant African Snail	
	Aves	Dove, Ostrich, Canary, Budgerigar	
Omnivores	Suidae	Pig	
(7)	Aves	Chicken, Duck, Goose, Turkey	
	Rodentia	Laboratory Mouse, Laboratory Rat	
Carnivores	Canidae	Dog, Silver Fox	
(5)	Felidae	Cat	
	Mustelidae	Ferret, Mink	(*21 Ruminants) potential domesticants

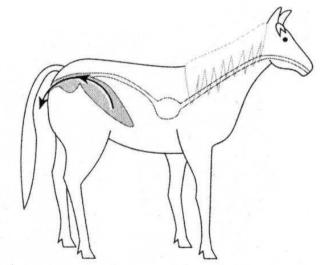

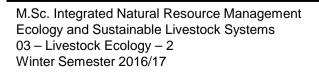

The major protein retention types

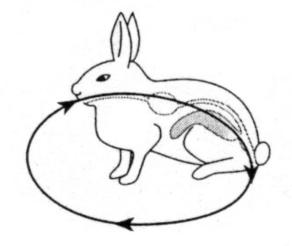

Ruminants (herbivores)

Monogastric herbivores

Coprophagous herbivores

Example: Grass eaters

M.Sc. Integrated Natural Resource Management Ecology and Sustainable Livestock Systems 03 – Livestock Ecology – 2 Winter Semester 2016/17

Example: Grass eaters

Predator-prey relationship between hare and lynx populations in the Canadian Arctic

Source: Colinvaux, Ecology 2, 1993

M.Sc. Integrated Natural Resource Management Ecology and Sustainable Livestock Systems 03 – Livestock Ecology – 2 Winter Semester 2016/17

Two hypotheses to explain the relationship between hare and lynx populations in the Canadian Arctic

Predation Hypothesis

- 1. Hare populations increase due to low predator populations
- 2. Lynx populations keep pace with hare populations
- 3. Lynxes become so numerous that they depress hare populations
- 4. Hare numbers decline due to intense lynx predation
- 5. Lynxes starve: population crashes
- 6. Hare populations recover

Food Shortage Hypothesis

- 1. Hare populations increase due to food abundance
- 2. Lynx populations keep pace with hare populations
- 3. Hare browse declines in quantity and nutritional content; allelo-chemicals increase
- 4. Hare numbers decline due to starvation; lower fecundity
- 5. Lynxes starve; population crashes
- 6. Hare populations recover

Parasitism

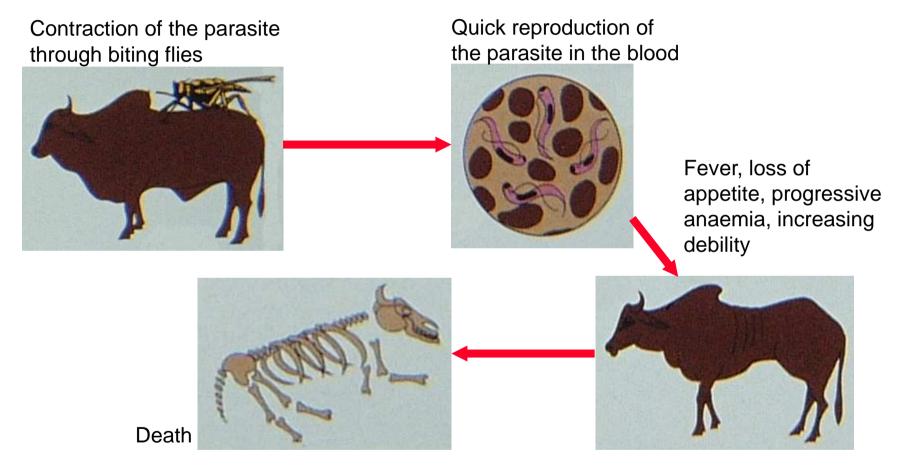

Trypanosoma is a parasite which is carried by the tsetse fly. This parasite causes a drastic reduction of animal numbers in large parts of Africa. Nearly nine million square kilometres in forty countries are afflicted with tsetse flies. Around forty-four million cattle and numerous sheep, goats, horses, donkeys and camels are endangered.
