33 Congreso Argentino de Producción Animal
Comarca Viedma, Patagonia – 13 al 15 octubre 2010
Seccion Sistemas de Produccion

Global Climate Change and Livestock Production

Dr. Horst Jürgen Schwartz
Professor (retired)
Chair for Livestock Ecology
Humboldt University of Berlin

Global Climate Change and Livestock production:
Relevance, Consequences & Perspectives

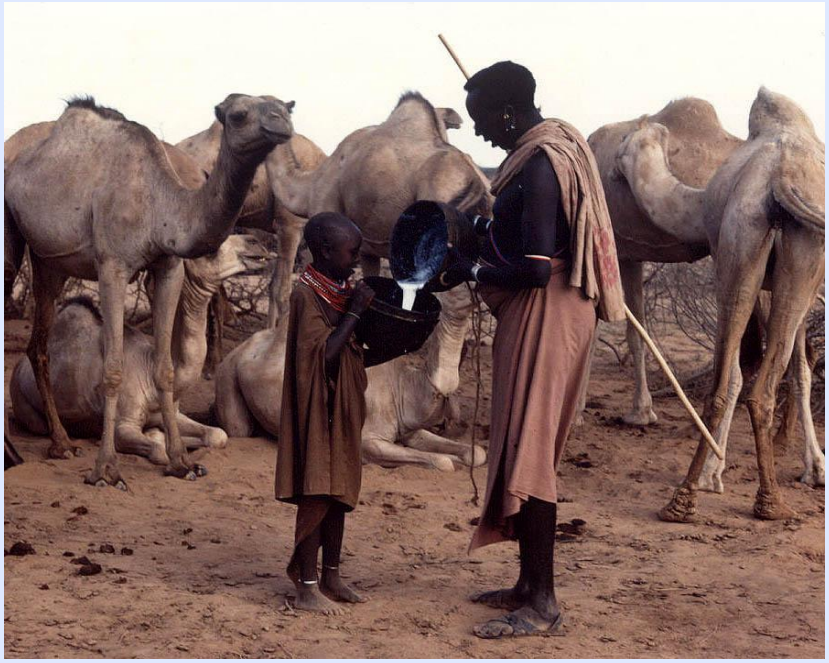
Why do we keep livestock?

Does livestock production contribute to climate change?

Is livestock production a victim of climate change?

Main functions of livestock production for society

Food security



Main functions of livestock production for society

Food security

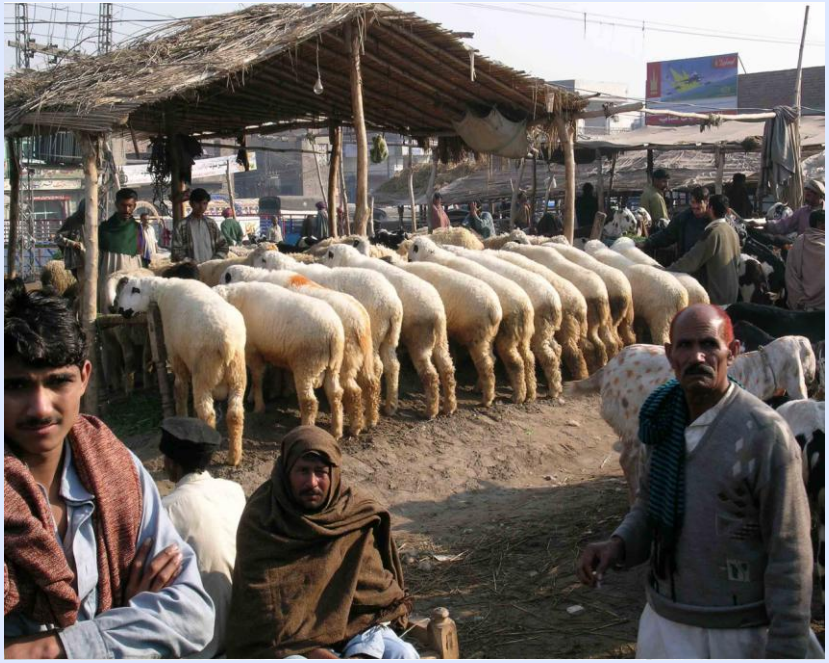
Services

Main functions of livestock production for society

Food security

Services

Income generation



Numbers and biomass of domestic animals and humans

Species	Numbers (million)	Biomass (million t)
Cattle & Buffalo	1 480	540
Sheep	1 065	40
Goats	780	27
Equines	118	42
Camelids	24	8.5
Pigs	936	122
Poultry	14 711	15
Total		**794.5**
Humans	**6 800**	**374**

Main functions of the environment (nature) for livestock production

Production base

Main functions of the environment (nature) for livestock production

Production base

Production reserve

Main functions of the environment (nature) for livestock production

Production base

Production reserve

Emission depository

Global Climate Change

Is the contribution by “ruminant” livestock substantial?

YES

Inputs

large quantity of low nutrient density
plant materials
&
water

intake by ruminant

The ruminant as a production system

RUMEN

anaerobic fermentation

animal metabolism
reproduction
growth
activity

Heat losses
Material losses
Indirect losses

small quantity

High nutrient density foods
Non-food products
Services

Outputs

Climate affecting emissions from livestock production

Gaseous emissions

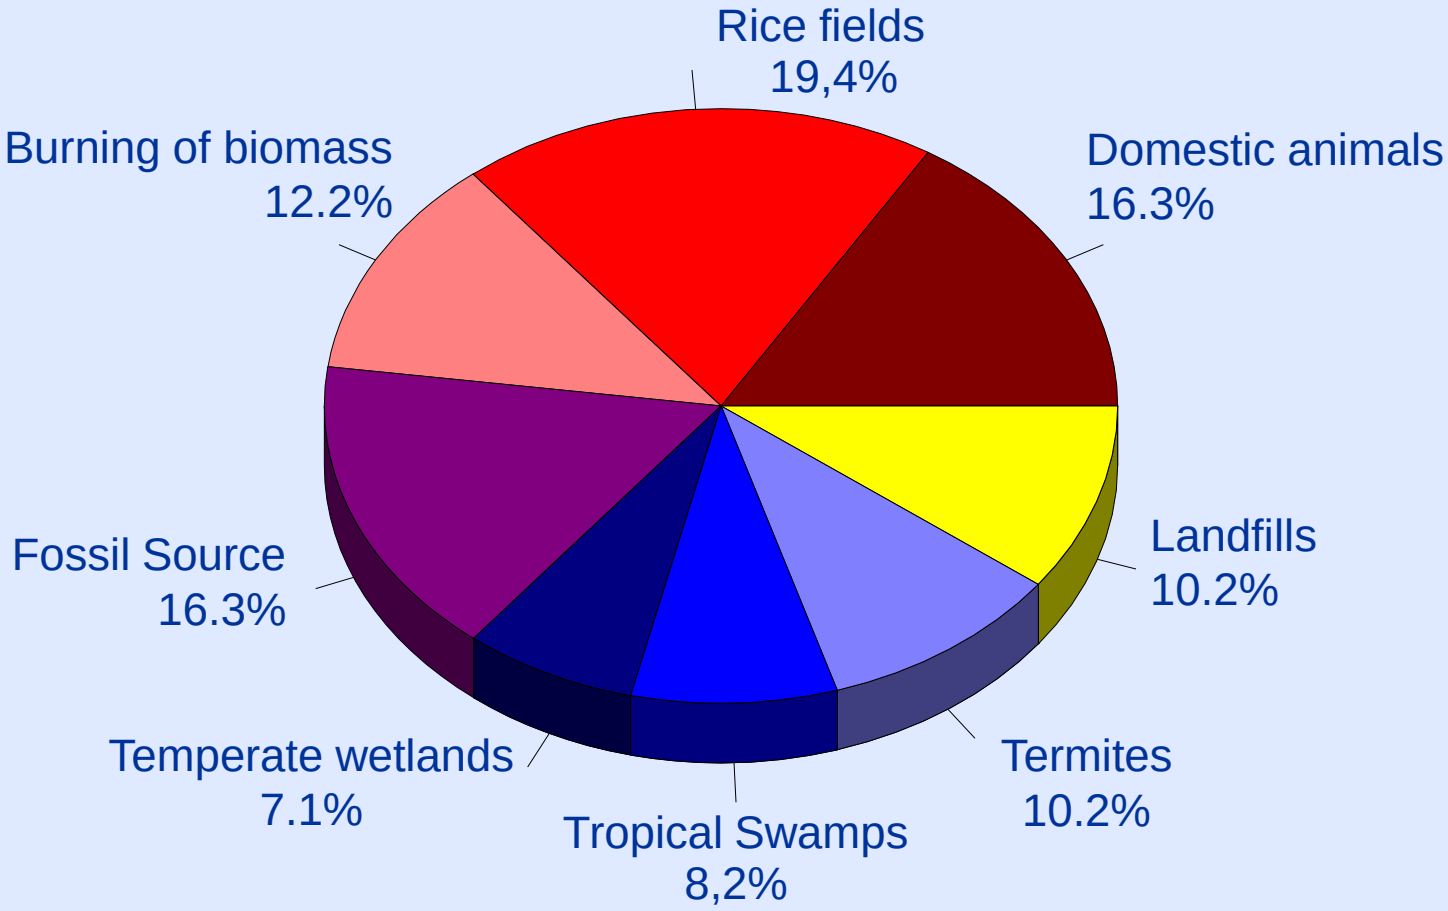
- **CO_2, carbon-dioxide**
- **CH_4, methane**
- **NH_3, ammonia & nitrous oxides**
- **Sulphur compounds**

Dust

Ash

Soot particles

Proportion of various sources in the global methane emission



Source: Walker, 1994

Climate affecting emissions out of livestock originate from:

Primary production:
Carbon-dioxide, Methane, Nitrous Oxide

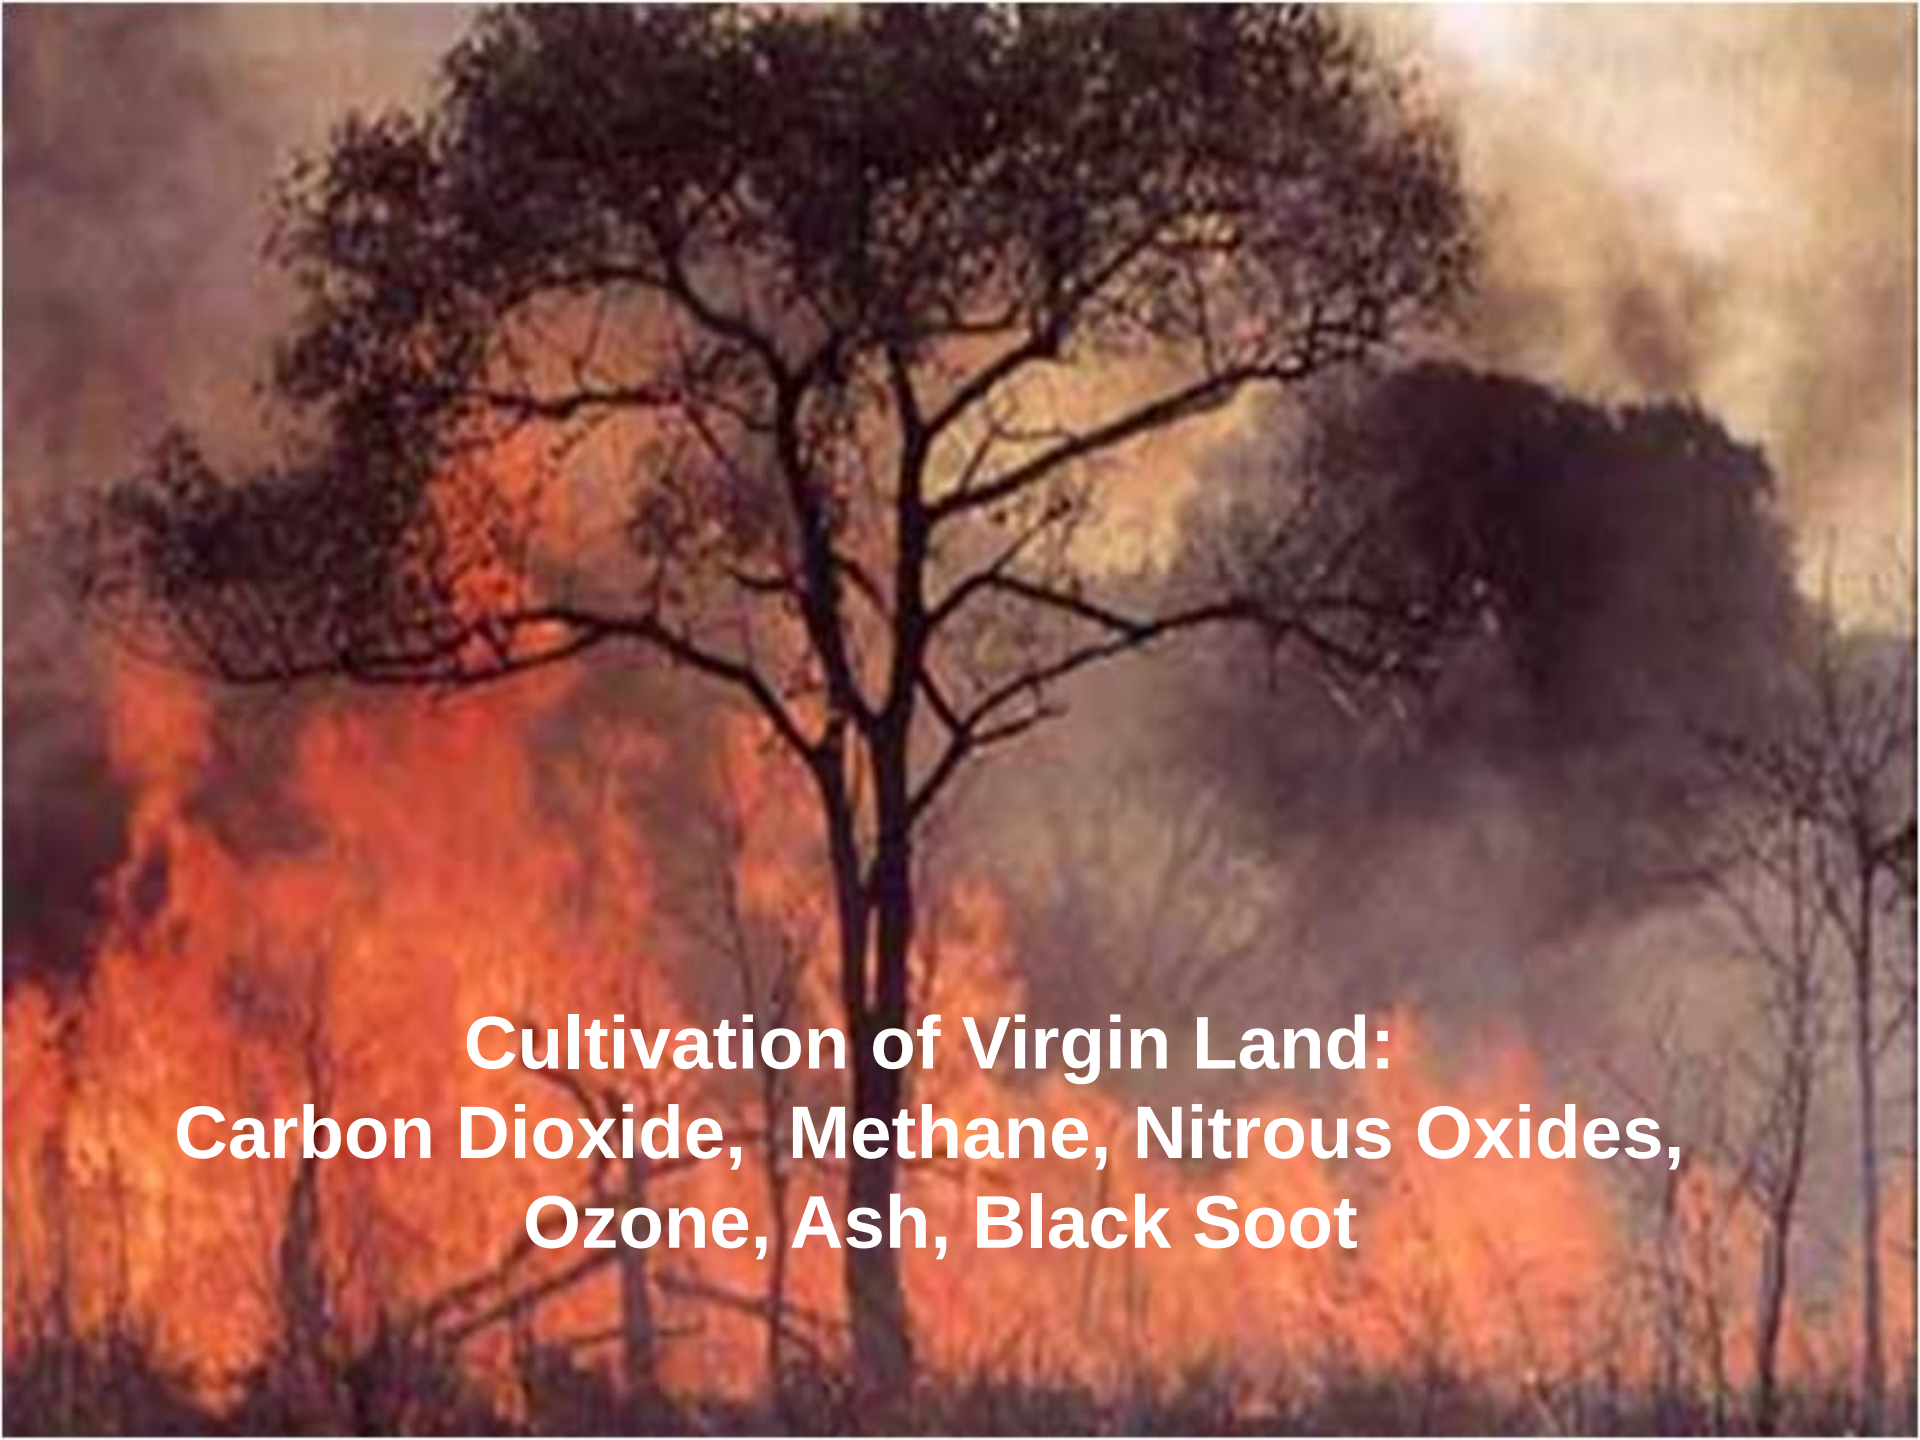
Secondary Production:
Carbon-dioxide, Methane, Ammonia,
Sulphur Compounds, Dust

Annual methane losses from a model livestock production system: dairy farming in S.W. England

(102 cows, 110 others, stall feeding of silage and concentrate)

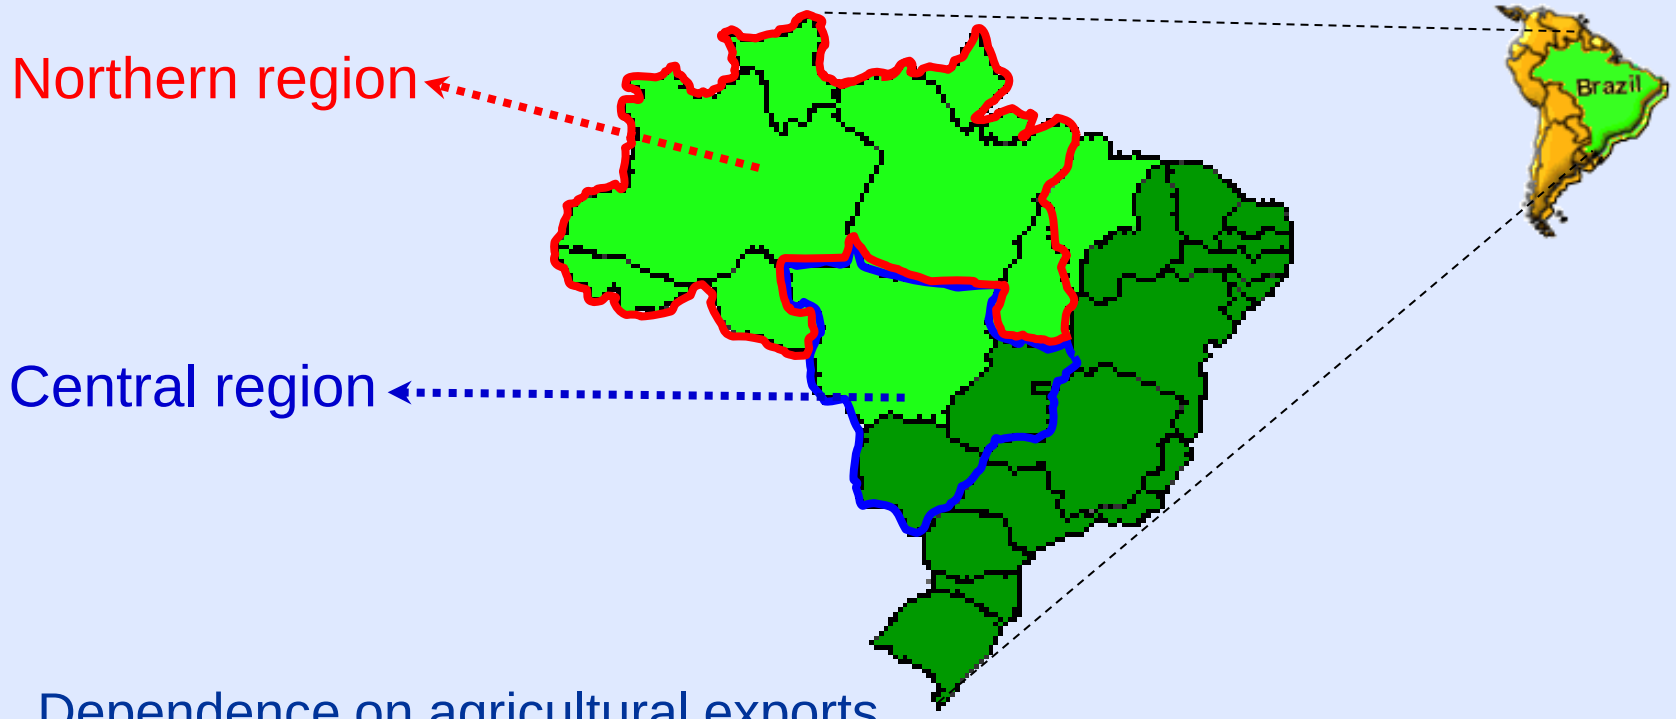
type of loss	total emission kg CH_4 - C $year^{-1}$
losses from ruminants	6775
losses from stored wastes	2285
losses from silage effluent	2596
losses from dirty water	332
total losses	11988

Source: after Jarvis & Pain, 1994



Cultivation of Virgin Land:
Carbon Dioxide, Methane, Nitrous Oxides,
Ozone, Ash, Black Soot

Agricultural expansion in Brazil

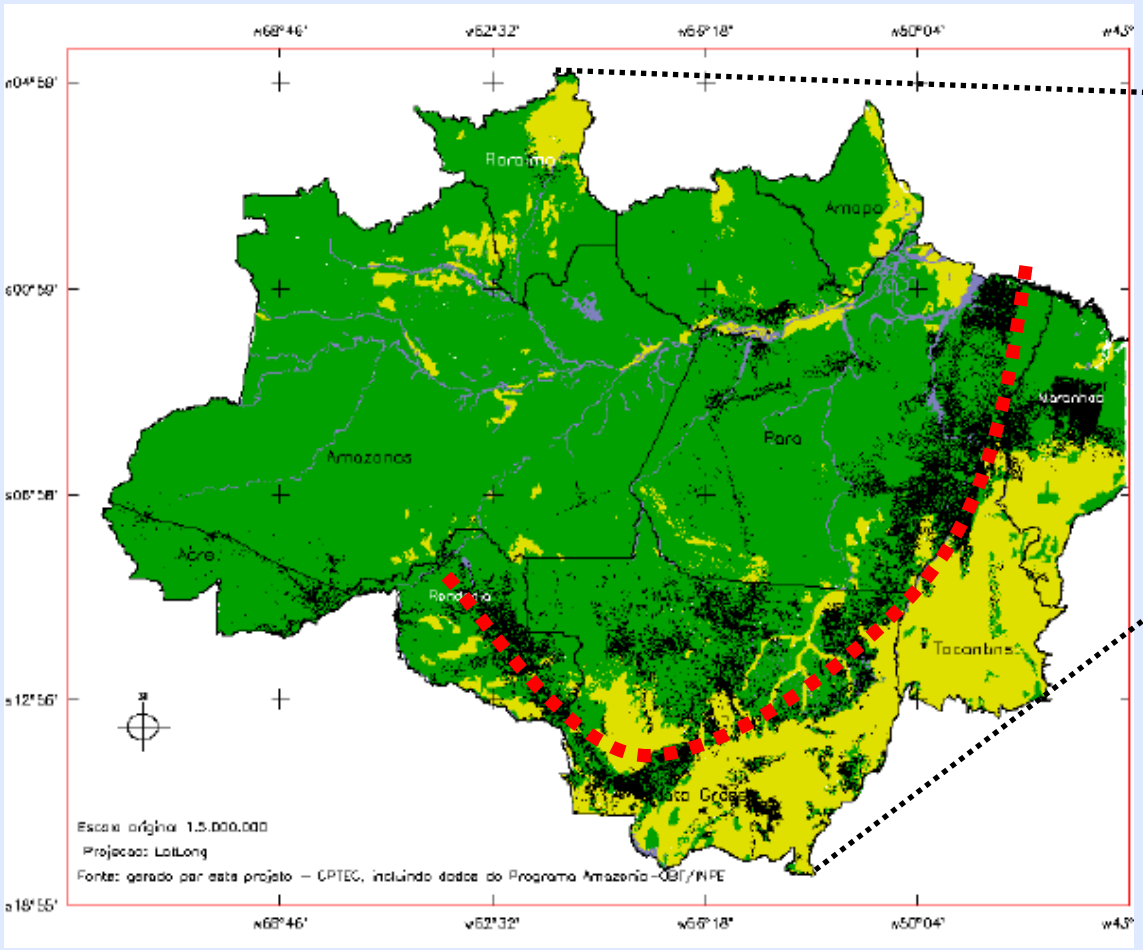


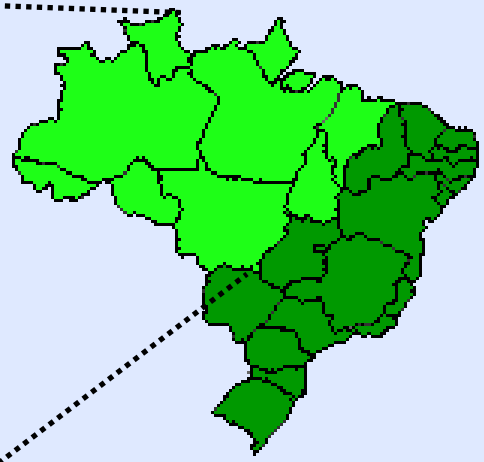
Dependence on agricultural exports

Beef exports are fastest growing commodity

Herd growth concentrated in Central and Northern Brazil

Source: D. Bungenstab, 2004

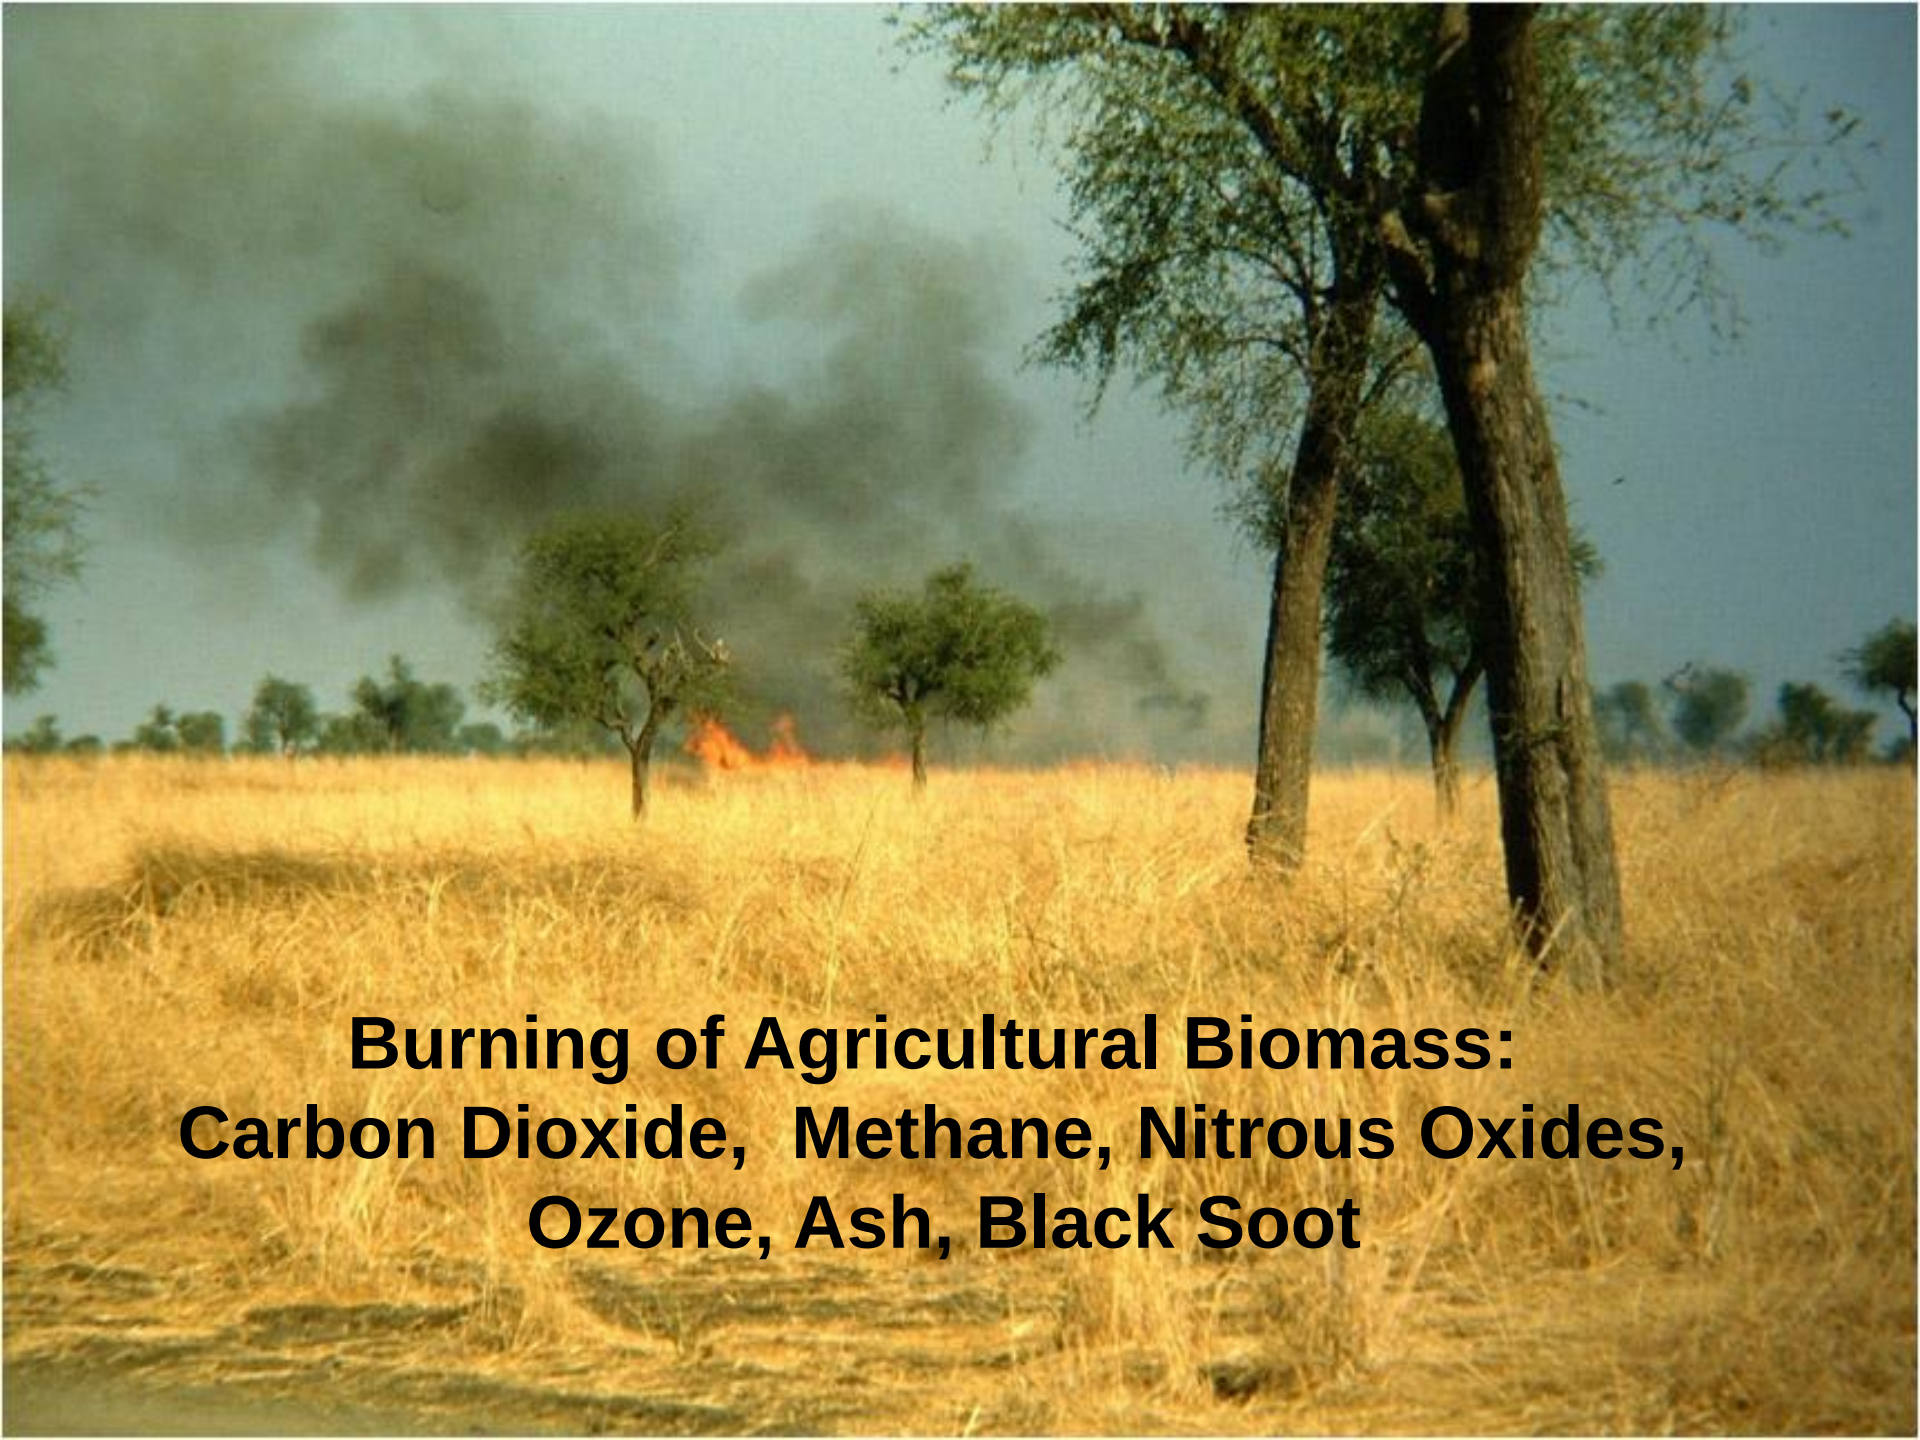




Deforestation:
20000 km² • yr⁻¹
50 to 60% for
cattle ranching

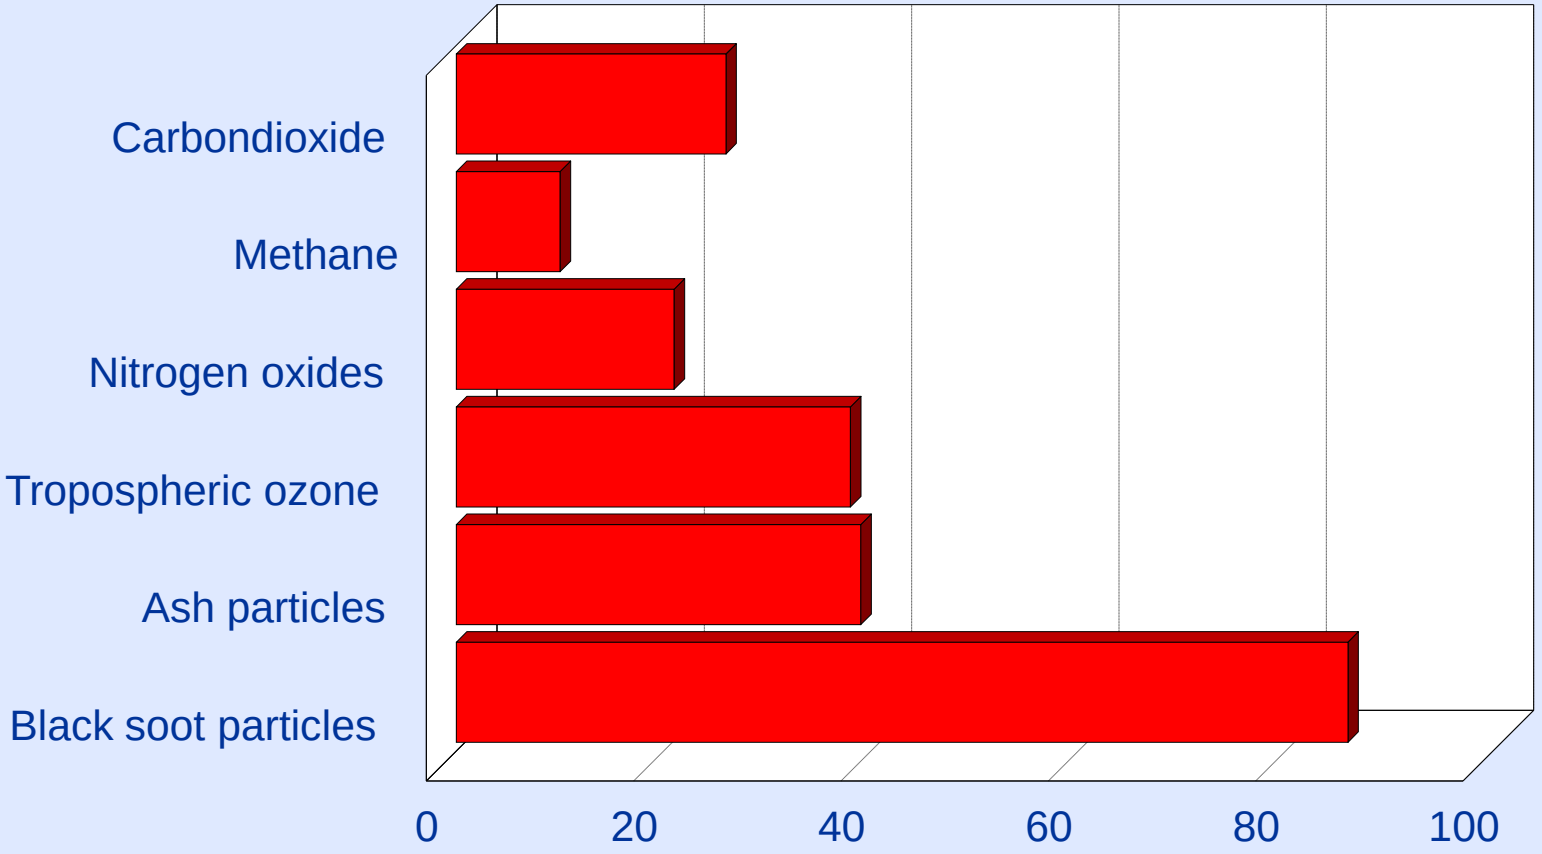
Rainforest Cerrado Deforestation

Source: D. Bungenstab, 2004



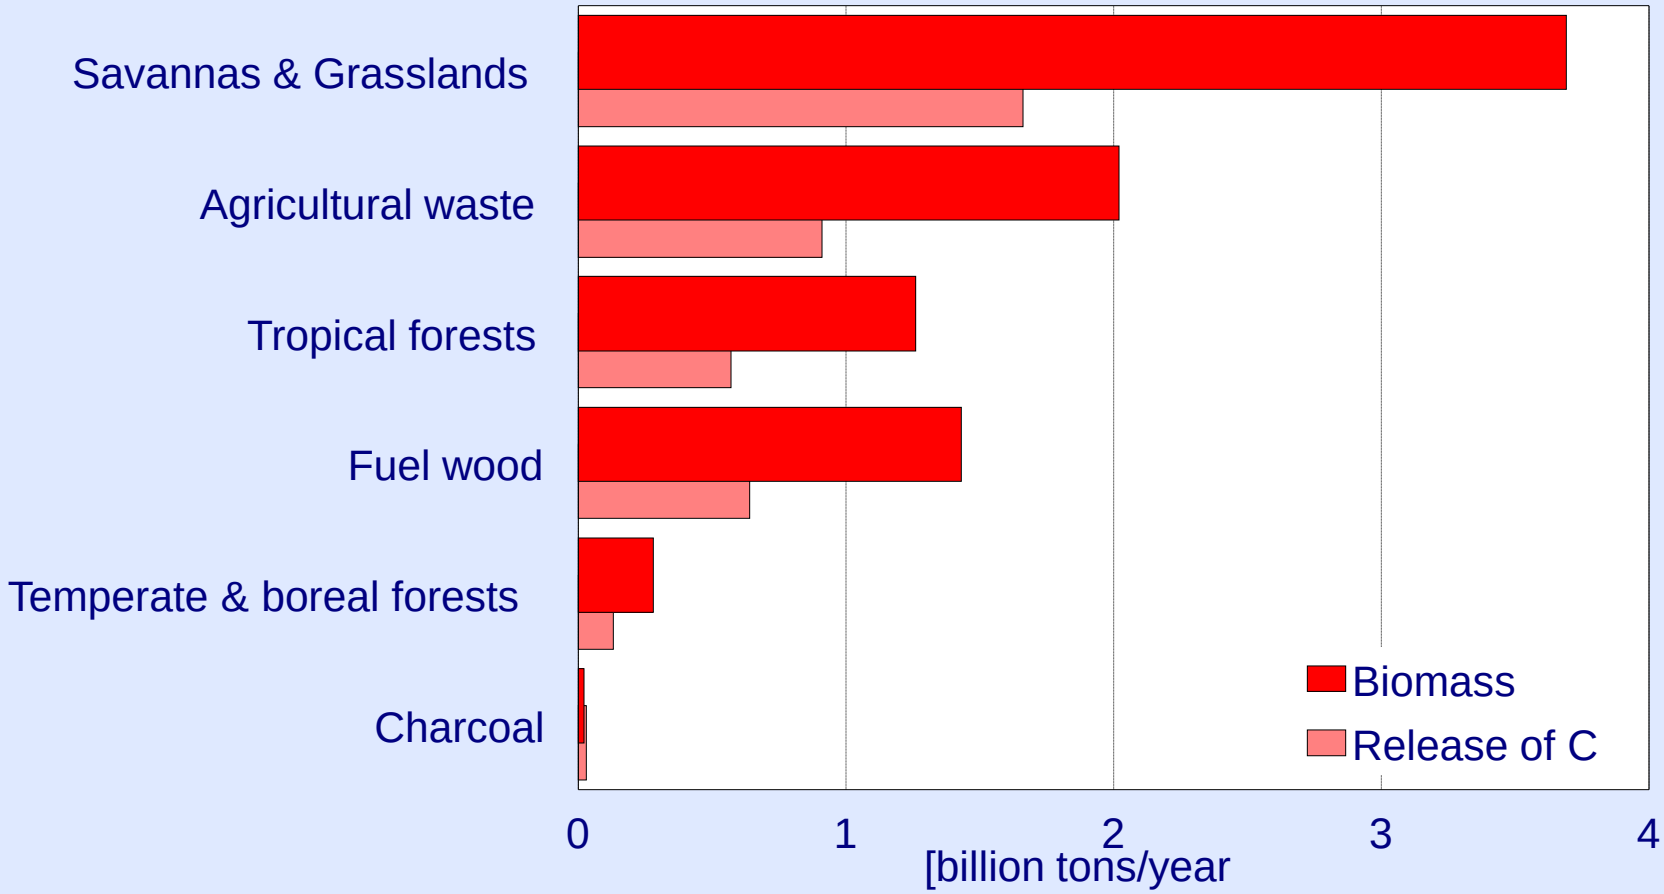
Burning of Agricultural Biomass:
Carbon Dioxide, Methane, Nitrous Oxides,
Ozone, Ash, Black Soot

Relative contribution of biomass burning to various climate affecting emissions [% of all emissions]



Source: Levine et al.; 1995

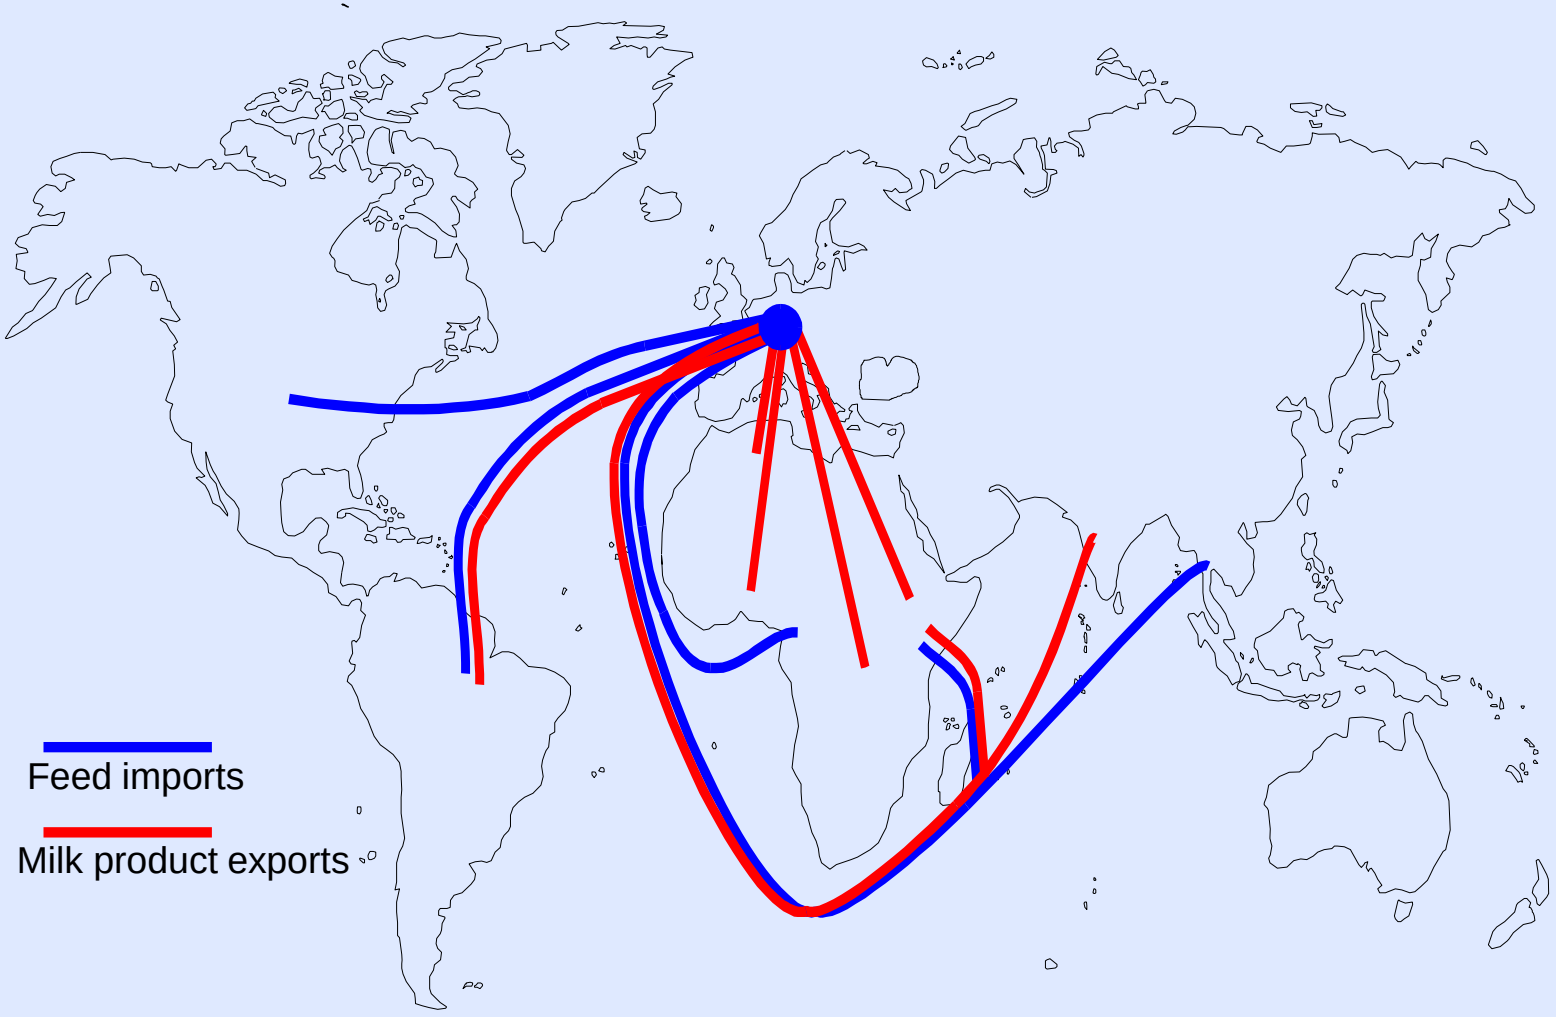
Contribution of burning various types biomass and the resulting release of carbon into the atmosphere



Source: Levine et al.; 1995

Local machine times and agricultural transports

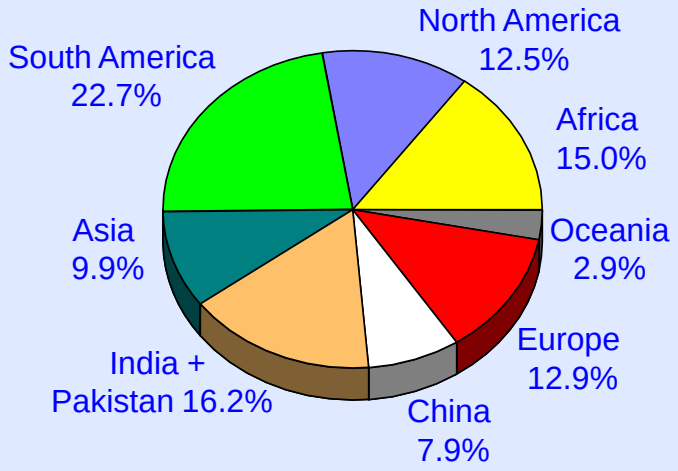
Transport routes of importance for Western European dairy production



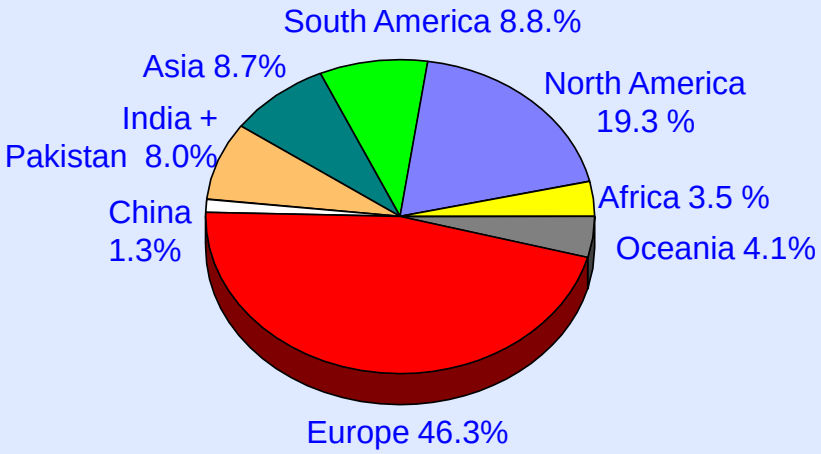
Regional distribution of CATTLE populations and proportion of regional production of meat and milk

Source: FAO Production Yearbook 2004

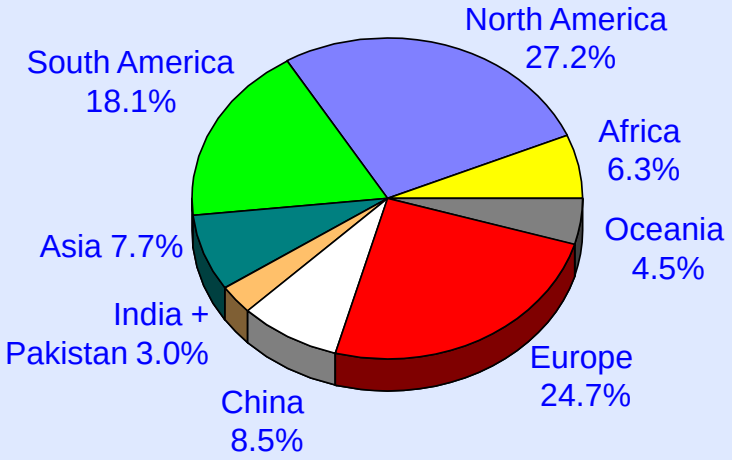
Populations



Milk

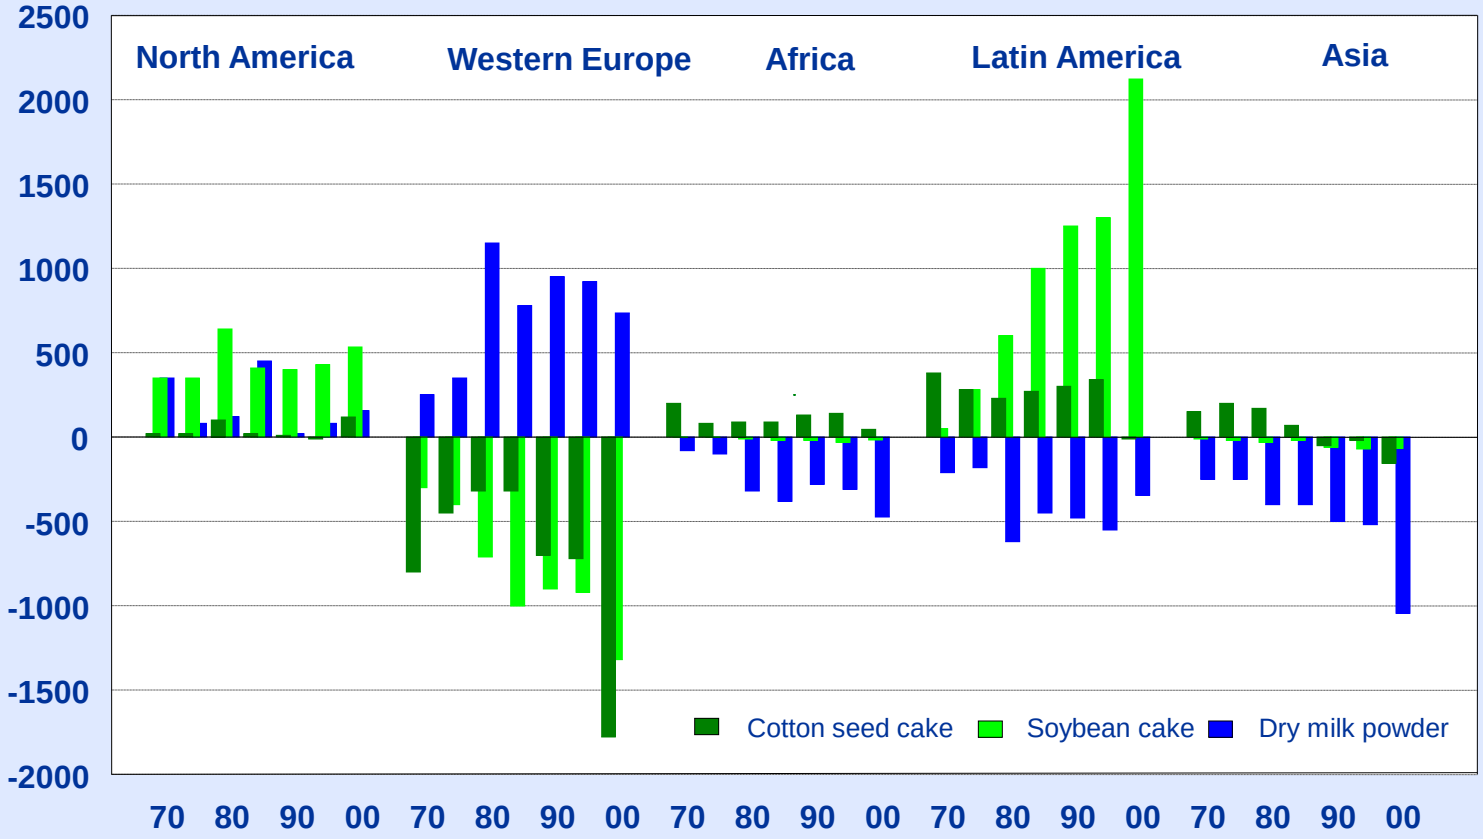


Meat



Black-and-white dairy cattle yielding from 6000 to 10000 litres of milk in a lactation of 9 months

Annual net trade ['000 t] of feeds and dry milk powder between the major economic regions of the world from 1970 to 2000



Source: FAO Trade Yearbooks 1970-2000

Enteric fermentation CH_4 emission levels of ruminants are affected by:

- animal species and genotype
- animal age and nutritional status
- animal performance level

- feed availability and intake level

- feed quality
  - nutrient density, digestibility, protein-energy ratio
  - seasonal variation
  - botanical composition
  - pasture and range management

Enteric fermentation CH_4 emission for dairy cattle in relation to average milk yield per cow

Region	Kg CH_4/head/year	Kg Milk/head/year	Kg Milk/Kg CH_4
North America	118	6700	57
Western Europe	100	4200	42
Eastern Europe	81	2550	32
Oceania	68	1700	25
Latin America	57	800	14
Asia	56	1650	29
Indian Subcontinent	46	900	20
Africa and Middle East	36	475	13

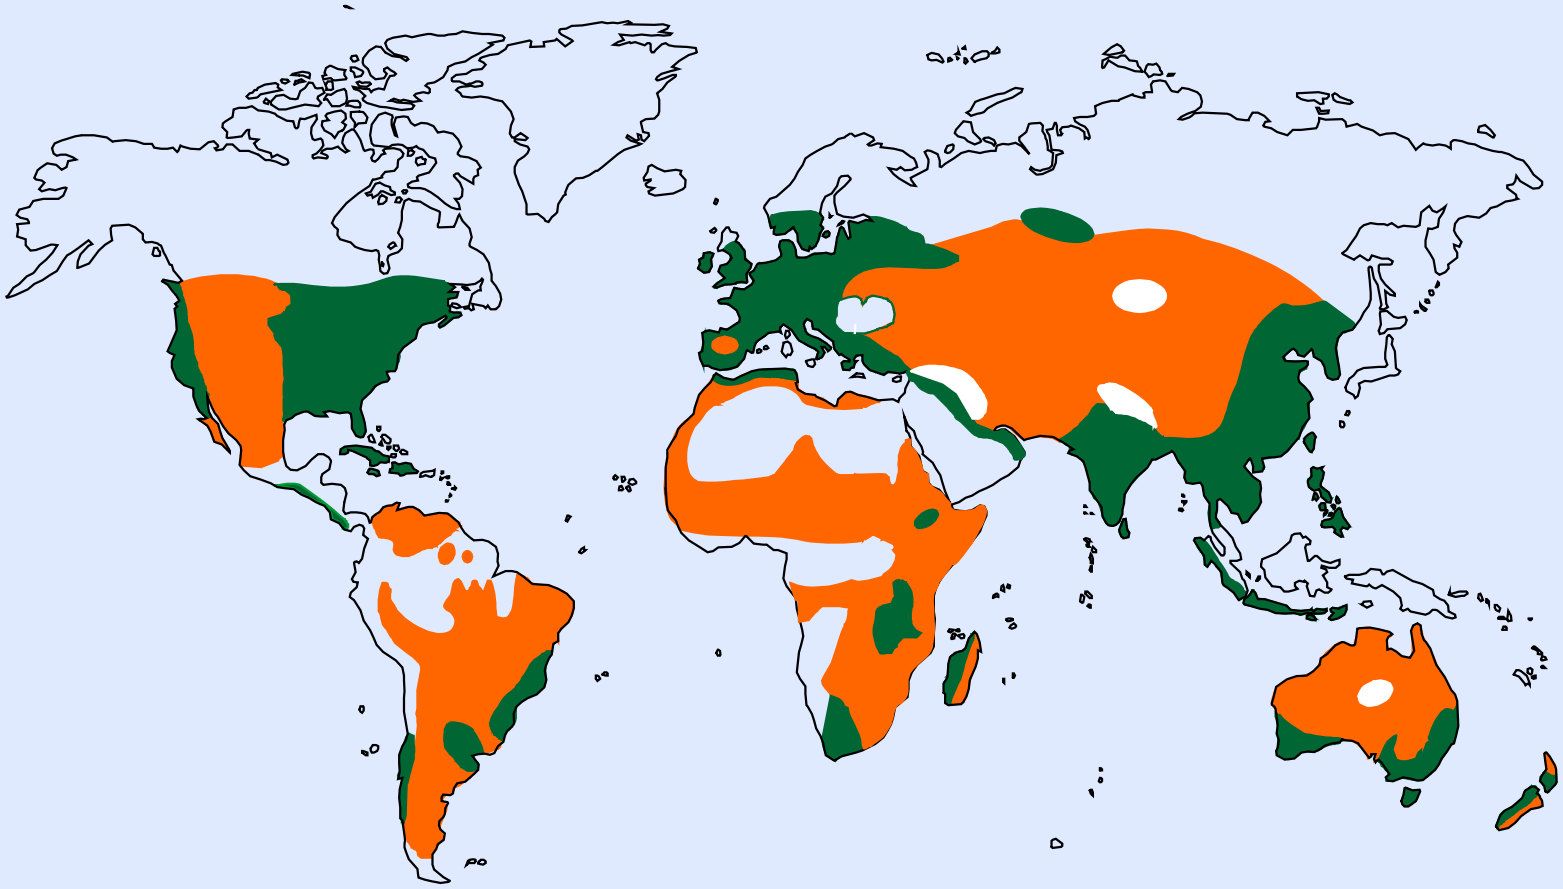
Worldwide distribution of crops and pastures as the base for livestock production systems



POSSIBLE TOOLS FOR THE CONTROL OF AGRICULTURAL EMISSIONS

Technical emission controls

- storing and handling
- application to land
- reduction of N-leaching
- mechanical treatment

Biological emission controls

- feeding the animals
- biological treatment of feeds
- manipulation of rumen microbes

Economic emission controls

- emission taxes
- consumption taxes
- product taxes
- subsidies for clean production
- emission quotas
- transferable emission quotas

Legal emission controls
